Some Thoughts on Climate  
William Happer  
Professor Emeritus, Department of Physics  
Princeton University

Expenditures on sound science to better understand climate are a good investment. Some research is providing extremely useful data on climate-related phenomena, with instrumentation in space, on land and in the oceans. Unfortunately, substantial resources are also being diverted into a cult of climate alarmism. There is an inordinate focus on ominous predictions of computer models that clearly do not work. Carbon dioxide, a gas essential for life, has been demonized as a "pollutant," and any mention of its benefits has been suppressed. Harmful policies are being based on this pseudo science
