

JEFFREY I. ZINK INORGANIC CHEMISTRY SEMINAR SERIES

Prof. Lior Sepunaru

Department of Chemistry and Biochemistry, University of California, Santa Barbara

"From molecular electrocatalysis to electro-assembly"

Abstract: When we think about electrochemistry, we mostly think about batteries. However, electrochemistry has been experiencing a renaissance in many other subdisciplines of chemistry in the last few years. In this talk, I will introduce the concept of nanoelectrochemistry and how it is used for detecting and quantifying freely diffusing species in solution. Together we will learn how this method can help understand catalysis at the nanoscale and how this method can be used for detecting any species, one at a time, and by that, learning about catalysts' heterogeneity. After that, I will describe our recent collaborative effort to use electricity as an external trigger to neutralize biomolecules, altering their secondary structure and assembling them. The concept is similar to what Frankenstein tried to do with his (gentle) monster, but we do that on a molecular scale. Overall, the primary motivation is to share with you what electrochemistry offers beyond conventional electrical storage and power devices.

Meet the Speaker

11:00 a.m. | YH 3096

Wednesday, April 5th, 2023

4:00 p.m. | YH4222 - Collaboratory
Yoo Seminar & Conference Hall
